

A new synthesis of 4'-trifluoromethyl-2,2':6',2''-terpyridine

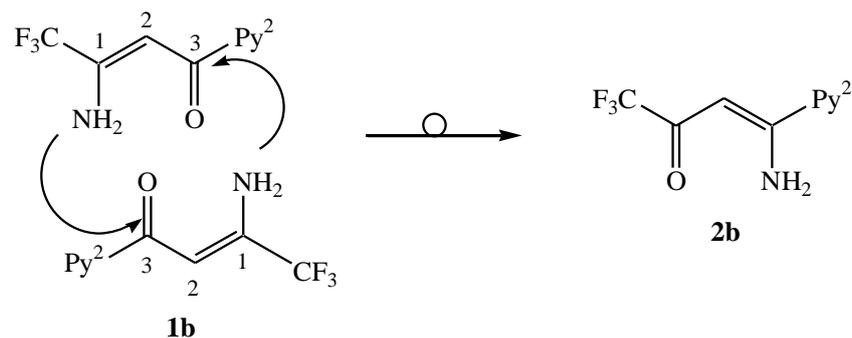

Vera I. Filyakova, Nadezhda S. Boltacheva, Marina G. Pervova and Valery N. Charushin

Scheme S1

Scheme S2

Scheme S3 Isomerization of AVK **1b** into AVK **2b**.

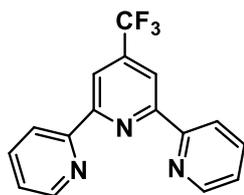

Materials and methods.

Regioisomeric AVKs **1b** and **2b** were obtained by the reaction of lithium (Z)-1,1,1-trifluoro-4-oxo-4-(2-pyridyl)but-2-ene-2-olate with ammonium acetate in glacial AcOH. AVK **1b**: mp 103 - 104 °C. AVK **2b**: mp 80 – 81 °C^{S1}.

The purity of compounds was monitored by TLC on Sorbfil plates (UV-254, eluent CHCl₃). Spots on the plates were detected by UV light and a treatment with Cu(OAc)₂ aqueous solution. ¹H and ¹³C spectra were recorded on Bruker DRX-400 and Bruker AVANCE-500 spectrometers using TMS as internal standards. ¹⁹F NMR spectra were recorded on Bruker DRX-400 spectrometer in CDCl₃ using C₆F₆ as the external standard and converted to the CFC₃ standard by the calculation of $\delta(\text{CFC}_3) = \delta(\text{C}_6\text{F}_6) - 162,93$. IR spectra were recorded on a Perkin-Elmer Spectrum One FT-IR instrument equipped with attenuated total reflection (ATR) or the diffusion reflection accessory (DRA) units for the 400–4000 cm⁻¹ range in solid form. Elemental analysis was carried out using a Perkin Elmer PE 2400 element analyzer. The GC-MS analysis was performed on GC-MS spectrometer Trace GC Ultra DSQ II (USA) with a quartz capillary column Thermo TR-5ms (polydimethylsiloxane, 5 wt % of phenyl groups, 30 m×0.25 mm, film thickness 0.25 μm, Figures S5 – S13) or column HP-5MS 30 m×0.25 mm ID x 0.25 μm (5% phenyl methyl silox, Figures S14 – S27) with a quadrupole mass-spectrometric detector with electron ionization (70 eV). Carrier gas helium, split ratio 1:50, flow through the column 1.0 ml min⁻¹. Scan of the total ionic current in the range 20–1000 Da. The initial column temperature was 40°C (storage 3 min), programming rate was 10 K min⁻¹ to 280 °C (storage 30 min). The temperatures of the injector 250°C, of the source 200°C, of the transfer line 200 °C. Solutions of the samples with a concentration of 4-5 mg ml⁻¹ were prepared in ethanol.

Synthesis of 4'-trifluoromethyl-2,2':6',2''-terpyridine 3b and 6'-trifluoromethyl-2,2':4',2''-terpyridine 4 A solution of AVKs **1b** and **2b** (0.6 g, 2.7 mmol each) in glacial acetic acid (5 ml) was boiled for 10 hours. The mixture was poured into water, extracted with diethyl ether (3×10 ml). The extract was washed with water (2×10 ml), the solvent was evaporated and residue was chromatographed on a column (eluent dichloromethane). The composition of each fraction was controlled by the GC-MS method. Fractions containing the highest amounts of Tpy **3b** (or Tpy **4**) were combined and further purified by column chromatography and then recrystallized from hexane, to obtain 0.31 g (37%) white crystals of Tpy **3b** and 0.012 g (1.4%) of a light yellow powder Tpy **4**. The solutions remaining after isolation of Tpy **3b** and Tpy **4** were combined, the solvent was evaporated and the residue was analyzed by GC-MS (Figures S9 – S14).

4'-Trifluoromethyl-2,2':6',2''-terpyridine **3b**

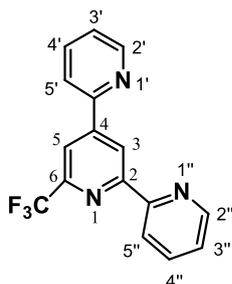

mp 144-145 °C, soluble in dichloromethane, chloroform, diethyl ether, ethyl acetate, acetone; insoluble in water. Found: C 63.77; H 3.38; N 13.96; F 18.95. Calc. for C₁₆H₁₀F₃N₃: C 63.79; H 3.35; N 13.95; F 18.92. IR (dra, cm⁻¹): 3091, 3060, 3019, 1587, 1568, 1468, 1448, 1404, 1374, 1265, 1168, 1124, 1091, 1070, 994, 895, 839, 792, 742, 717, 663, 621.

¹H NMR (500 MHz, CDCl₃) δ: 8.77 m (2H), 8.74 s (2H), 8.66 d (*J* = 8.3 Hz, 2H), 7.92 td (*J* = 7.8, 1.5 Hz, 2H), 7.42 m (2H). ¹⁹F NMR (470.5 MHz, CDCl₃), δ: -65.81 s (CF₃). ¹³C NMR (CDCl₃) δ_C 116.70 (q, *J* 5.0), 121.37 (s), 123.20 (q, *J* 268.5), 124.49 (s), 137.03 (s), 140.49 (q, *J* 31.2), 149.36 (s), 154.87 (s), 156.78 (s).

GC-MS: τ_R = 24,31. MS (EI) *m/z* (rel. intensity, %) 301 (100.0%) [M]⁺; 273 (24); 232 (18) [M-CF₃]⁺; 223 (16) [M-Py²]⁺; 203 (8) [M-Py²-HF]⁺; 151 (10); 128 (8); 78 (28) [Py²]⁺; 51 (10).

6'-Trifluoromethyl-2,2':4',2''-terpyridine **4**

mp 119.5-120.5 °C, soluble in dichloromethane, chloroform, diethyl ether, acetone; insoluble in water. Found: C 63.82; H 3.40; N 13.92; F 18.85. Calc. for C₁₆H₁₀F₃N₃: C 63.79; H 3.35; N 13.95; F 18.92. IR (dra, cm⁻¹): 2955, 2924, 2853, 1609, 1587, 1559, 1478, 1444, 1425, 1372, 1265, 1232, 1179, 1159, 1124, 1074, 1043, 994, 904, 783, 671, 646, 619.

¹H NMR (500 MHz, CDCl₃) δ: 7.36 – 7.41 m (2H), 7.86 – 7.89 m (2H), 8.04 d (*J* = 7.95, 1H), 8.45 d (*J* = 1.20, 1H), 8.56 d (*J* = 7.95, 1H), 8.72 d (*J* = 4.80, 1H), 8.80 d (*J* = 4.50, 1H), 9.18 s (1H). ¹⁹F NMR (470.5 MHz, CDCl₃), δ: - 69.07 s (CF₃).

GC-MS: τ_R = 23,48. MS (EI) *m/z* (rel. intensity, %) 301 (100.0%) [M]⁺; 273 (24); 261 (4), 232 (18) [M- CF₃]⁺; 223 (16) [M-Py²]⁺; 203 (8) [M-Py²-HF]⁺; 151 (10); 128 (8); 78 (28) [Py²]⁺; 51 (10).

Isomerization of AVK **1b** into AVK **2b**

The sample of (0.05 g, 0.00023 mol) AVK **1b** was thermostated at 110 °C for 2 hours, analyzed by GC-MS (Figures S17–S21); then this sample was thermostated at 110° C for an additional 8 hours and analyzed by GC-MS (Fig. S15 – S28). *NOTE.* The presence of the Tpy **3b** impurity in this sample (Figures S14–S16) does not interfere with the study of the isomerization process.
